

To whom it may concern,

I urge you to vote against this proceeding. Fast non-preferential service is essential to free enterprise, competition, innovation, user-choice, and free speech.

The notion that ISPs need to be allowed to manipulate client-server connection speeds based on the bandwidth usage

- is a caricature of how the Internet actually works.
- hobbles new businesses in the IT and content production economy. It increases the cost of market entry.
- impedes businesses' ability to reach new users. Investment in new ideas will dry up.
- gives ISPs control over what users are able to view or say.

Vote against this proceeding.

Sincerely,
Sam Clark
